

Colour Cote™ Sprayed Glass

Colour Cote™ is the new revolutionary sprayed system for colouring glass of differing types. **Colour Cote™** is a two pack with the ability to in house mix any pigments to achieve an infinite range of BS and RAL colours; the spray is applied at room temperature and is dry to the touch in one hour. **Colour Cote™** gives even the smallest processor the opportunity to produce unique new looks for, ever demanding Architect's and clients.

Colour Cote™ can be sprayed onto monolithic glass such as Toughened, Textured and Float with striking results. Alternatively it can be Resin (CIP) laminated after it has been applied, so as encapsulating the sprayed surface, this ability to laminate after spraying eliminates the problem of Toughened coloured laminated glass and the sometimes-objectionable clear tape edge. The applications and advantages of **Colour Cote™** are endless; Glass is a non-porous water resistant, low maintenance building solution unlike marble, Grout jointed ceramics and veneers, it is also an extremely hygienic material to use in Kitchens and wet room applications.

Colour Cote™ when used as a wall cladding is simply bonded to the wall or surface using a silicone or fixing compound, alternatively the glass can be drilled and bolt fixed.

Colour Cote™ has been exhaustively tested so as to give a durable and reliable finish; the following tests are just some of the testing programmes.

*B.S. 1006:1961 Grey scale 3
B.S. 1006:A02 assessing scale
Test conducted on a Xenotest 150
1-8 blue wool scale*

A light fastness of 7+ was achieved on the entire range of colours tested, which results in **Colour Cote™** having a 10-year internal (monolithic) & a 10-year external when C.I.P. laminated guarantee.
